Non-invasive method for diagnosis of hypertrophic cardio-myopathy useful for testing asymptomatic individual(s).

AAQ91121-Q91130 are nested PCR primers used for the amplification and identification of beta-cardiac myosin heavy-chain RNA. They are used in a new non-invasive method for diagnosing hyperrophic cardiomyopathy (HC), the method involves detecting the presence or absence of specific HC-associated mutations in the beta-cardiac myosin heavy-chain obtained from a blood sample. The method may be used to diagnose familial or sporadic HC and the non-invasive method is particularly important when testing

```
ö
asymptomatic individuals suspected of having the disease. The method has a broad applicability and may be used to detect mutations responsible for other genetically inheritable diseases e.g. cystic fibrosis, Gaucher's disease, haemophilia A and B, Duchenne's muscular dystrophy, sickle cell anaemia, Tay-Sachs disease and phenylketonuria
                                                                                                                                                                                                                                                                                                                                           Human; ss; PCR; primer; beta cardiac myosin heavy chain; FHC; familial hypertrophic cardiomyopathy; SHC; Gaucher's disease; sporadic hypertrophic cardiomyopathy; life expectancy; haemophilia; buchenne's muscular dystrophy; sickle cell anaemia; Tay-Sachs disease; phenylketonuria; cystic fibrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detecting a presence or absence of a mutation associated with hypertrophic cardiomypathy, useful for diagnosing cystic fibrosis or hemophilia, by detecting a mutation in an amplified product of a beta cardiac myosin heavy-chain DNA.

associated with hypertrophic cardiomyopathy (sporadic or familial, SHC and FHC) comprises detecting a mutation associated with hypertrophic cardiomyopathy in an amplified product of a beta cardiac myosin heavy chain DNA. The mutations associated with SHC/HC are detected in the myosin gene isolated from blood, by detecting mis-marched areas in RNA-DNA hybrid double strands (RNA from the normal gene, DNA from the suspect sample). FHC associated point mutation can be classified and used to determine life expectancy in affected individuals e.g. using a Kaplan-Meier curve for the classified type of FHC causing point mutation. Also included are an RNA probe comprising ribonucleotides arranged in a sequence which is complementary to at least a portion of beta-cardiac myosin heavy-chain DNA and a set of DNA oligonucleotide primers for amplifying beta-cardiac myosin heavy-chain DNA comprising at least two

mutation

The invention relates to detecting the presence or absence of a

```
ö
oligonucleotides capable of amplifying beta-cardiac myosin heavy-chain DNA. The method is useful for detecting the presence or absence of a mutation associated with hypertrophic cardiomyopathy. This method is especially useful for diagnosing SHC and FHC, as well as for determining the estimated the life expectancy of a person with familial hypertrophic cardiomyopathy. In particular, the method is useful for determining an individual's genetic information, and diagnosing e.g. Gaucher's disease, hacmophilia, Duchenne's muscular dystrophy, sickle cell anaemia, Taysachs disease, heapth stronuria or cystic fibrosis. The present sequence is a nested PCR primer used to amplify a region of the beta cardiac myosin heavy chain cDNA containing an FHC-associated mutation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         mutation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detecting mutations associated with hypertrophic cardiomyopathy to diagnose hypertrophic cardiomyopathy, comprises amplifying beta-cardiac myosin heavy-chain DNA and detecting the mutation in the amplified product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to detecting the presence or absence of a mutation associated with hypertrophic cardiomyopathy (familial or sporadic, FHC, SHC) for facilitating the diagnosis of hypertrophic cardiomyopathy, comprising amplifying beta-cardiac myosin heavy-chain DNA forming an amplified product, and detecting the presence or absence of a mutation associated with hypertrophic cardiomyopathy in the amplified product, thus, facilitating the diagnosis of hypertrophic cardiomyopathy. Also included are a set of DNA oligonucleotide primers for amplifying beta-cardiac myosin heavy-chain DNA comprising at least two oligonucleotides
                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human beta cardiac myosin heavy chain mutation detection primer D'A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; beta cardiac myosin; heavy chain; PCR; primer; ss; FHC;
familial hypertrophic cardiomyopathy;
sporadic hypertrophic cardiomyopathy.

cardiomyopathy associated mitration in the beto of detecting a hypertrophic cardiomyopathy by being capable of detecting a hypertrophic cardiomyopathy cardiomyopathy (comprising the diagnosis of hypertrophic cardiomyopathy (comprising a first container diagnosis of hypertrophic cardiomyopathy (comprising a first container cardiomyopathy associated mutation, a second container of holding primers for amplifying beta-cardiac myosin heavy-chain DNA, and and the components of the kit to detecting a more cardiomyopathy-associated mutation, a second container cardiomyopathy-associated mutation in holding primers for amplifying beta-cardiac myosin heavy-chain DNA and instructions for using the components of the kit to detect the presence or absence of a hypertrophic cardiomyopathy cardiomyopathy cansociated mutation in amplified beta-cardiac myosin heavy-chain DNA). The method is used for detecting the presence or absence of a mutation associated with chypertrophic cardiomyopathy for facilitating the diagnosis of for hypertrophic cardiomyopathy relies on the presence of typical chypertrophic cardiomyopathy relies on the presence of typical chypertrophy. The present invention is une-invasive and based, at least in part, on the discovery that hypertrophic cardiomyopathy is caused by point mutations in the beta cardiac myosin heavy-chain gene. Prior art creveals that there are no extensive studies involving a large number of families which established that this particular disease or disorder was caused by point mutations in the beta cardiac myosin heavy-chain gene and in the beta cardiac myosin heavy-chain gene.

The present sequence is a PCR primer used to amplify a region of the beta
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cardiac myosin heavy chain having a disease-related point mutation.

Producing monodispersed preparation of polyanionic polymer for therapy, by expressing vector comprising ligation product of oligonucleotides encoding glutamate/aspartate residues in host cell and isolating the product

Disclosure; Fig 5; 74pp; English

The present invention describes a method (M) for producing a monodispersed preparation of a polyanionic polymer (PP) larger than 10 CC Monodispersed preparation of a polyanionic polymer (EV) a ligation product formed by ligating together oligomuclectides that encode glutamate/aspartate residues, expressing EV in a host cell, and isolating compressing EV in a host cell, and isolating compressing EV in a host cell, and isolating compressing to the protein product (P) of EV, where (P) is PP and at least 80% of PP is approximately of the same molecular weight. Also described: (1) a compressing a polyanionic polymer and comprise to polyanionic polymer and at polyanionic polymer polyanionic polymer is polyanionic polymer is polyanionic polymer is polyanized and in a vector (III) comprising a polyanionic polymer is polyanized and at comprise a nucleotide sequence encoding a polyanionic polymer is polyanized and or polyanized sequence encoding a polyanionic polymer is polyanized acid or polyaspartic acid; (4) production of (I); (5) a cell (IV) comprising (III) or a vector that is larger than 10 kDa; and (6) a recombinantly-produced polyanionic polymer (V) that is of any molecular combinantly-produced polyanionic polymer (V) that is of any molecular combinatering (I) to the individual. (I) is also useful for delivering an effective amount of a pharmaceutically active agent, a therapeutic and ceffective amount of a pharmaceutically active agent, a therapeutic protein or a drug to a patient in need of it, or for diagnostic and testing or research purposes. ABZ22045 to ABZ22131 and ABB56374 to ABB56400 represent sequences used in the exemplification of the present invention 88999999999999999999999

```
The present invention describes a method (M) for producing a monodispersed preparation of a polyanionic polymer (PP) larger than 10 compodispersed preparation of a polyanionic polymer (EV) a ligation product (P) involves inserting into an expression vector (EV) a ligation product (P) of EV, where (P) is PP and at least 80% of PP is glutamate/aspartate residues, expressing EV in a host cell, and isolating comprising together coligonal product (P) of EV, where (P) is PP and at least 80% of PP is approximately of the same molecular weight. Also described: (1) a correct recombinant fusion protein (I) comprising a polyanionic polymerial and polyanionic polymer (II) comprising a polyanionic polymer and comprises a nucleotide sequence encoding a polyanionic polymer and at least one other nucleotide sequence encoding a polyanionic polymer and at least one other nucleotide sequence, where the polyanionic polymer is polygultamic acid or polyaspartic acid; (4) production of (I); (5) a cell (IV) comprising (III) or a vector that comprises a nucleotide sequence that is larger than 10 kDs; and is conjugated to another protein. (I) is useful for treating a disease or aliment in an individual by comprise than 10 kD, and is conjugated to another protein. (I) is useful for treating a disease or aliment in an individual by administering (I) to the individual. (I) is also useful for delivering and effective amount of a pharmaceutically active agent, a therapeutic protein or a drug to a patrient in need of it, or for diagnostic and the polyanion or research purposes. The invention relates to a human immunoglobulin heavy chain binding protein, BiP(78KD) (Y90693), having a 639 amino acid sequence, and to the protein, BiP(78KD) (Y90694). The invention also encompasses a BiP(78KD) protein of 633 amino acids (Y90694). The cDNA encoding BiP(78KD) also referred to as p78 in the specification, was isolated from human chondrosarcoma cell lines. The BiP(78KD) cDNA of this invention contains a number of differences compared with the published sequence (GenBank at number X87949), and has therefore has been deposited with genBank with the accession number AF188611). These differences comprise 6 single nucleotide substitutions and a codon insertion, and result in three amino acid substitutions and an arginine insertion at position 834-cc fire protein. The BiP(78KD) proteins react with matibodies present in the serum of rheumatoid arthritis patients, and is therefore a cutthritis. BiP(78KD) or peptides derived from the protein are useful as cragents to indicate the presence of rheumatoid arthritis, and can be used in prognostic or diagnostic tests of body fluids for rheumatoid arthritis by ELISA (enrywellinked immunosorbent assay) or Western blotting. The protein or the CDNA encoding it can also be used to test for rheumatoid arthritis by BiP(78KD) its peptides and polynucleotides are also useful.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      therapeutically. Sequences A30743-A30794 represent human BiP(78KD) PCR primers used in an exemplification of the invention for subcloning into a bacterial expression vector. The sequence of the primers are based on the previously published BiP(78KD) sequence (GenBank X87949)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Zollinger Ellison syndrome; gastrointestinal ulceration; congenital microvillus arrophy; skin disease; cell growth; abnormal keratinocyte differentiation; psoriasis; epithelial cancer; Parkinson's disease; Alzheimer's disease; ALS; neuropathy; fibromodulin; dermal scarring; Usher Syndrome; Atrophia areata; anti-thrombotic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

Yuan J; Chen J,

Example 33; Page 140; 320pp; English.

oligonuclectides AAX52276-532 represent PCR primers and probes used to isolate and amplify cDNA encoding secreted and transmembrane human proteins (see AAX52213-74 and AAY13144-403). The cDNA sequences are brain feetal brain, fetal liver and fetal retina. The cnocked polypeptides have specific uses based on their homology to known polypeptides, e.g. PRO211 and remaince of gastrointestinal mucosa and the repair of acute and chronic mucosal lesions (e.g. enterocolitis, Zollinger-Ellison syndrome, gastrointestinal ulceration and congenital microvillus atrophy), skin diseases associated with abnormal keratinocyte differentiation (e.g. psoriamis, epithelial cancers such as lung squamous cell carcinoma of the vulva and gliomas), potent effects on cell growth and development, diseases related to growth or survival of nerve cells including Parkinson's disease, Alzheimer's diseases, Alzheimer's diseases, Alzheimer's disease, Alzheimer's disease, PRO2533 may scarring. PRO264 can be used as a target for anti-tumor drugs. PRO533 may

The polymetric state of the invention may be useful as research tools and as therapeutics for treating enterocolitis, Zollinger-Blisen syndrome, gastrointestinal ulceration, psoriasis, cancer, Parkinson's disease, Alzheimer's disease, ALS, neuropathies, dermal scarring and wound healing, nerve repair, thrombosis, bone and/or cartilage formation, angiogenesis, asthma, rheumatoid arthritis, multiple sclenosis, inflammatory disorders, atherosclerosis, cardiac injury, infertility, premature aging, AIDS, diabetes complications and stroke. The molecules may also be utilised during gene therapy procedures and transgenic animal production. The current sequence is that of the PCR primer of the invention which was used to analyse the human PRO DNA of

Novel nucleic acids encoding secreted and transmembrane polypeptides with homology, e.g. to growth and cancer-associated antigens.

polypeptides. The PRO polypeptides are useful for treating skin diseases (e.g. poworlasis), cancers (e.g. lung squamous cell carcinoma), gastrointestinal disorders (e.g. enterocolitis), neurodegenerative diseases (e.g. Alzheimer's disease, Parkinson's disease), wound repair, cardiovascular disorders (e.g. endometrial bleeding angiogenesis, ischaemias such as coronary ischaemia, atherosclerosis), inflammatory disorders (e.g. asthma, rheumatorid arthritis, multiple sclerosis), infertility, AIDS and diabetes and retinal disorders such as retinitis pigmentosum. The PRO nucleic acids have applications in molecular phology, including use as hybridization probes, and in chromosome and gene mapping
one nucleic acids encoding novel secreted and transmembrane PRO

```

The invention relates to an isolated nucleic acid with at least 80% nucleic acid sequence identity to a nucleotide sequence encoding one of 61 secreted/transmembrane polypeptides, or PRO polypeptides or encoding a PRO protein extracellular domain. Also included are a vector comprising the PRO nucleic acid, a host cell comprising the vector, producing a PRO

The invention describes a new isolated nucleic acid molecule comprising the full length coding sequence of the DNA deposited with the American Type Culture Collection (e.g. ATCC Deposit No. 209258), or a sequence with at least 80% identity to a DNA encoding a PRO polypeptide comprising any of 61 sequences having 164-1119 amino acids fully defined in the Specification. The PRO polypeptides or polymucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. These are capair, collateral blood vessel formation, canners (e.g. colorectal cancer), haemorrhage (or reduce risk for hemorrhage), rheumatoid arthritis, diabetes, cirrhosis of the liver, fibrosis of the lungs, cretenosis, dermal fibrotic conditions (e.g. keloids or scarring), cischaemia, strokes, hypertension, heart attacks, atherosclerosis, or infertility in mammals (e.g. humans, dogs, cats, atherosclerosis, or infertility in mammals (e.g. humans, dogs, cats, cattle, horses, sheep, pigs, goats, or rabbits) The PRO polypeptides are useful as targets for therpeutic intervention in these diseases, and diagnostic determination of the presence of these diseases, The PRO polypeptides are also useful as molecular weight markers, or for chromosome identification. The PRO cas molecular weight markers, or for chromosome identification. The PRO chuman cDNA, genomic DNA, mand. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene This sequence of therapy are also mand, and processed in the presence of therapy and permit a novel human secreted and transmembrane PRO polypeptide
                                                                                                    New genes and secreted and transmembrane polypeptides (e.g. PRO245 or PRO335), useful for treating or diagnosing e.g. Alzheimer's disease, cancers, hemorrhage, rheumatoid arthritis, diabetes, cirrhosis, ischemia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; PRO; secreted protein; transmembrane protein; enterocolitis; gastrointestinal ulceration; skin disease; 8s; PCR; primer; abnormal keratinocyte differentiation; psoriasis; epithelial cancer; squamous cell carcinoma; Alzheimer's disease; Parkinson's disease; amyotrophic lateral sclerosis; inflammatory disease; rheumatoid arthritis; asthma; multiple sclerosis; organ failure; atherosclerosis; cardiac injury; infertility; birth defect; diseature aging; AlDS; acquired immunodeficiency syndrome; cancer; diabetic complication; wound repair.

                                                                                                                                                                                                                                                                                                                                                       07-NOV-1997
                                                                                                                                                                                                                                                                                                                                                                             18-NOV-1997
                                                                                                                                                                                                                                                                                                                                                                                                                               NOV-1997
```

The invention relates to an isolated PRO polypeptide having at least 80% amino acid sequence identity to: (a) any one of 61 fully defined amino acid sequence glaven in the specification (appearing as ABU54347-ccc deposited under American Type Culture Collection (accession numbers CC listed in the specification); (c) any one of the PRO sequences which clisted in the specification); (c) any one of the PRO sequences which lacks its associated signal peptide; (d) an extracellular domain of the PRO polypeptide which lacks its associated signal peptide; or (e) an one correctly associated signal peptide; or (e) an an include are the nucleic acids encoding the PRO polypeptides, vectors, host cells and anti-PRO articodies. The PRO polypeptides and mucleic acids are useful in diagnosing or treating corrects such as squamous cell carcinoma, Alzheimer's disease, Parkinson's cancers such as squamous cell carcinoma, Alzheimer's disease, parkinson's cancers such as squamous cell carcinoma, Alzheimer's disease, e.g. cheuratoid arthritis, asthem or multiple sclerosis, organ fallure, catherosclerosis, cardiac injury, infertility, birth defects, premature disease, amyortrophic lateral sclerosis, inflammatory diseases e.g. crheuratoid arthritis, asthem or multiple sclerosis, organ fallure, catherosclerosis, cardiac injury, infertility, birth defects, premature also useful for wound repair and associated therapies concerned with re-growth of tissue. The nucleotide sequences may be used an hybridisation probes in chromosome and gene mapping, or in generating antisense RNA and DNA. PRO nucleic acids are also useful in preparing PRO polypeptides, in assays to identify other proteins or molecules are also useful in the ergoperate transgenic animals or knockout animals, which in turn are useful in the adversagence and successing purposes. The anti-PRO antibodies may be used in electrophoresis purposes. The anti-PRO antibodies may be used in electrophoresis purposes. The anti-PRO antibodies may be breased electrophoresis purposes are com New PRO polypeptides and nucleic acid molecules, useful in diagnosing or treating inflammatory diseases, organ failure, atherosclerosis, cardiac injury, infertility, cancer, AIDS, Alzheimer's disease or Parkinson's Gaps Ferrara N; ME, Goddard A; ME, Goddard Kljavin IJ; ö Tumas D; 66.2%; Score 17.2; DB 8; Length 24; 86.4%; Pred. Novel secreted and transmembrane polypeptides and polynucleotides encoding them useful for treating abnormal bleeding involved in gynecological diseases, skin diseases and neurodegenerative diseases

Example 33; Page 105; 478pp; English.

The invention relates to an isolated PRO polypeptide. PRO317 is useful in diagnosing or treating abnormal bleeding involved in gynecological diseases e.g. to avoid or lessen the need for hysterectomy. PRO317 may also be useful as an agent that affects angiogenesis and PRO317 is useful in anti-tumour indications or in treating coronary ischaemic conditions. PRO311 and PRO317 polypeptides are useful for treating disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal lesions, skin diseases associated with abnormal keratinocyte differentiation (e.g. psoriasis).

                  Alzheimer's disease, amyorrophic lateral sclerosis (ALS), neuropathies and disease related to uncontrolled cell growth, e.g. cancer. PRO219 polypeptide plays a regulatory role in the blood coagulation cascade. PRO246 polypeptides which serves as tumour specific antigens may be exploited as therapeutic targets for anti-tumour drugs. PRO269 collypeptide is useful as an antithrombotic agent with reduced risk for haemorrhage as compared with hepatin. PRO317 polypeptide is useful in treating endometrial bleeding angiogenesis. PRO287 polypeptides and polypeptides are useful for treating asthma, rheumatoid arthritis, protain and multiple sclerosis. The polypeptide and its nucleic acid are useful for tissue typing. PRO antibodies are useful for tissue typing. PRO antibodies are useful in diagnostic assays for PRO e.g. detecting its expression in specific cells, tissues or serum and for affinity pursient sequence represents a human secreted/transmembrane PRO entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane entransmembrane en

                                                                                                                                                                                                                                                                                                                                 .8-NOV-1997
                                                                                                                                                                                                                                                                                                                                                                       24-NOV-1997
                                                                                                                                                                                                                                                                                               07-NOV-1
  The invention discloses isolated PRO secreted/transmembrane polypeptides and the nucleic acid encoding them. The polypeptides can be used to raise and the nucleic acid encoding them. The polypeptide, for linking a bioactive molecule to a cell expressing a PRO polypeptide, for linking a bioactive molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. The PRO polypeptides or polymorleotides are also useful as pharmaceuticals, diagnostics, concerns or bioreactors, for detecting or treating e.g. hyperplasia, endometriosis, cancers (e.g. those involving solid tumours), ischaemia, coronary attertial disease, polycystic kidney disease, chronic or acute renal failure, or inflammatory responses (e.g. asthma, rheumatoid arthritis, psoriasis or multiple sclerosis) in mammals. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The sequences presented in ABX96017-ABX96378 are the genes encoding, the primers amplifying and the probes detecting the PRO polynucleotides of the invention
                                                                                                                                                                                                                                                                                                                                               ö
          New secreted and transmembrane PRO polypeptides (e.g. PRO533 or PRO245) and genes encoding them, useful for detecting or treating e.g. hyperplasia, endometriosis, cancers, ischemia, coronary arterial disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; gene therapy; mucosal lesion; ulcer; enterocolitis; skin disease; postiasis; cancer; lung cancer; oclon cancer; nerve cell disease; Alzheimer's disease; Parkinson's disease; Usher syndrome; angiogenesis; atrophia areata; inflammatory disease; asthma; rheumatoid arthritis;

                                                                                                                                                                                                                                                                                                                                                                               The invention relates to sixty one nucleic acids encoding PRO
polypeptides (secreted and transmembrane). The polynucleotide is useful
in molecular biology, including uses as hybridisation probes, in
chromosome and gene mapping, in generating antisense RNA and DNA, and in
gene therapy. The polynucleotide may also be used in preparing PRO
polypeptides by recombinant techniques, and in generating PRO
transgenic animals or knock-out animals which, in turn, are useful in the
development and screening of therapeutically useful reagents. The PRO
polypeptide or the antibody is used in preparing a medicament for
treating a condition responsive to the polypeptide or antibody, such as
mucosal lesions e.g. ulcars and enterocollitis, skin disease e.g.
psoriasis, cancer e.g. lung cancer and colon cancer, nerve cell disease
e.g. Alzheimer's disease and Parkinson's disease, Usher syndrome,
atrophia areata, anglogenesis, inflammatory disease e.g asthma and
rheumatoid arthritis, ischaemia, and in various diagnostic assays. The
present sequence represents an PCR primer used in isolating a PRO

The invention relates to an isolated, secreted and transmembrane polypeptide, termed PRO polypeptide. The polypeptide is useful for identifying agonists or antagonists of the polypeptide, for preparing variants of the polypeptide. The polypeptide is useful for recombinantly electrophoresis purpose and the nucleic acid is useful for recombinantly expensing those markers. The polypeptide is also useful as therapeutic agent. PRO is useful in assays to identify other proteins or molecules involved in binding interaction. The nucleic acid is useful as therapeutic acid is useful as therapeutic acid in the development and screening of therapeutically useful activolved in the development and screening of therapeutically useful activolates the PRO and for the generic analysis of individuals which encodes the PRO and for the generic analysis of individuals with genetic disorders, in gene therapy, for chromosome identification, as chromosome marker, and for generating probes for polymerase chain reaction (PCR), or useful in diagnostic assays for prolymerase chain reaction of PRO, is useful in diagnostic assays for PRO, e.g. detecting its expression in specific cells, tissues or serum and for affinity purification of FRO from recombinant cell culture or natural sources. The polypeptide or its antibody is useful for the preparation of medicament for treating conditions which is responsive to the PRO polypeptide or anti-PRO antibody is useful for the preparation of medicament for treating obesity, diabetes or hypo- or hypor-insulinaemia and cardiac insulficiency disorders, for inhibiting tumour growth, enhances vascular permeability and immune response, for inducing regeneration of auditory hair cells and for reating bearing loss in mammals and for treating bone and/or cartilage represented bear and arthiring the present sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         represents a human secreted and transmembrane PRO polypeptide PCR primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel secreted and transmembrane polypeptide for modulating biological activity of cell expressing the polypeptide, identifying agonists or antagonists of polypeptide, and as molecular weight markers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ashkenazi A, Botstein D, Desnoyers L, Eaton DL, Ferrara N; Filvaroff E, Fong S, Gao W, Gerber H, Gerritsen ME, Goddard A; Godowski PJ, Grimaldi JC, Gurney AL, Hillan KJ, Kljavin IJ; Mather JP, Pan J, Paoni NF, Roy MA, Stewart TA, Tumas D; Williams PM, Wood WI;

New PRO polypeptides and nucleic acid molecules, useful in diagnosing or treating inflammatory diseases, organ failure, atherosclerosis, cardiac injury, infertility, cancer, AIDS, Alzheimer's disease or Parkinson's disease.

Example 33; Page 99; 473pp; English.

The invention describes sixty one nucleic acids encoding PRO polypeptides (secreted and transmembrane). The PRO polypeptides and nucleic acids are useful in diagnosing or treating enterocolitis, gastrointestinal ulceration, skin diseases associated with abnormal keratinocyte differentiation, e.g. psoriasis or epithelial cancers such as squamous

cell carcinoma, Alzheimer's disease, Parkinson's disease, amyotrophic lateral Socierosis, inflammatory diseases, e.g. rheumatorid arthritis, asthma or multiple sclerosis, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, diabetic complications, or mutations in general. The polypeptides are also useful for wound repair and associated therapies concerned with regrowth of tissue. The PRO polypeptides and nucleic acid molecules are also useful in gene therapy, and as molecular weight markers for protein electrophoresis purposes. The anti-PRO antibodies may be used in diagnostic assays for PRO, or for the affinity purification of PRO from recombinant cell culture or natural sources. This sequence represents a

The invention relates to an isolated secreted and transmembrane PRO polypeptides are useful for modulating biological activity of a cell, in diagnosing or treating abnormal bleeding involved in gynaecological diseases e.g. to avoid or lessen the need for hysterectomy, for treating angiogenesis, tumour, coronary ischaemic condition, disorders associated with the preservation and maintenance of gastrointestinal mucosa and the repair of acute and chronic mucosal elsions, skin diseases associated with abnormal keratinocyte differentiation (e.g. psoriasis), Parkinson's disease, Alzheimer's disease, amyotrophic lateral sclerosis (ALS), neuropathies, disease cascade disorders, neurodegenerative disease, thrombosis, haemorrhage, endometrial bleeding, wound healing, tissue repair, asthma, rheumatoid arthritis, multiple sclerosis. Nucleic acid encoding PRO polypeptides are useful in molecular biology including uses as hybridisation probes and in the generating transgenic animals or knockout animals. The PRO antibodies are useful for tissue typing. PRO antibodies are useful for immunohistochemical staining and/or assay of sample fluids. Anti-PRO antibodies are useful in diagnostic assays for pro affinity purification of PRO from recombinant cell culture or natural coursemenbrane PRO polypeptides a human secreted and course. The present sequence represents a human secreted and course.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        gastrointestinal mucosa, mucosal lesion, skin disease, keratinocyte differentiation, psoriamis; Parkinson's disease, Alzheimer's diseases, amyotrophic lateral sclerosis; ALS, neuropathy; cell growth, cancer, tumour, viral infection, neurodegenerative disease, antithrombotic agent; haemorrhage; endometrial bleeding angiogenesis; kidney tissue, apptosis; therapeutic; tissue typing; immunohistochemical staining; gene therapy; nootropic; neuroprotective; cytostatic; virucide; anticoagulant.
                                                                                                  Novel secreted and transmembrane polypeptides and polynucleotides encoding them useful for treating abnormal bleeding involved in gynecological diseases, skin diseases and neurodegenerative diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          66.2%; Score 17.2; DB 9; Length 24; 86.4%; Pred.
